 → notion of holomorphic functions.
- Symplectic structures. Allow to compute areas: $\omega : T_p M \times T_p M \rightarrow \mathbb{R}$ antisymmetric. $\omega \in \Omega^2(M), d\omega = 0, \omega^d \neq 0, \dim M = 2d.$

Main focus

Classify smooth (compact) manifolds with a given structure.

Given a smooth (compact) manifold *M*, does it admit a complex or a symplectic structure?

Given a smooth (compact) manifold *M*, does it admit a complex or a symplectic structure?

Given a smooth (compact) manifold M, does it admit a complex or a symplectic structure?

If (M, ω) is symplectic, $\omega \in \Omega^2(M)$, $d\omega = 0$, $\omega^d \neq 0$, dim M = 2d.

4 D N 4 B N 4 B N 4 B

Given a smooth (compact) manifold M, does it admit a complex or a symplectic structure?

If (M, ω) is symplectic, $\omega \in \Omega^2(M)$, $d\omega = 0$, $\omega^d \neq 0$, dim M = 2d. $\implies \Omega = \omega^d$ is a volume form that can be integrated. Then $\int_M \omega^d > 0$.

A (10) > A (10) > A (10)

Given a smooth (compact) manifold M, does it admit a complex or a symplectic structure?

If (M, ω) is symplectic, $\omega \in \Omega^2(M)$, $d\omega = 0$, $\omega^d \neq 0$, dim M = 2d. $\implies \Omega = \omega^d$ is a volume form that can be integrated. Then $\int_M \omega^d > 0$. So $[\omega]^d \neq 0 \in H^{2d}(M)$,

4 A N

Given a smooth (compact) manifold M, does it admit a complex or a symplectic structure?

If (M, ω) is symplectic, $\omega \in \Omega^2(M)$, $d\omega = 0$, $\omega^d \neq 0$, dim M = 2d. $\implies \Omega = \omega^d$ is a volume form that can be integrated. Then $\int_M \omega^d > 0$. So $[\omega]^d \neq 0 \in H^{2d}(M)$, hence $[\omega] \neq 0 \in H^2(M)$ and $b_{2k}(M) = \dim H^{2k}(M) > 0$, k = 1, ..., d.

Given a smooth (compact) manifold M, does it admit a complex or a symplectic structure?

If (M, ω) is symplectic, $\omega \in \Omega^2(M)$, $d\omega = 0$, $\omega^d \neq 0$, dim M = 2d. $\implies \Omega = \omega^d$ is a volume form that can be integrated. Then $\int_M \omega^d > 0$. So $[\omega]^d \neq 0 \in H^{2d}(M)$, hence $[\omega] \neq 0 \in H^2(M)$ and $b_{2k}(M) = \dim H^{2k}(M) > 0$, k = 1, ..., d.

This is an example of a number of topological obstructions for admitting a geometrical structure.

Topology ~>> Geometry.

- Rational homotopy type $\pi_k(M) \otimes \mathbb{Q}$ is determined by $H^k(M)$ (formality).
- Kähler (fundamental) groups.

Topological properties of Kähler manifolds

- b_{2k+1} are even.
- $\wedge \omega^{d-k} : H^k(M) \xrightarrow{\cong} H^{2d-k}(M)$ (hard-Lefschetz).
- Rational homotopy type $\pi_k(M) \otimes \mathbb{Q}$ is determined by $H^k(M)$ (formality).
- Kähler (fundamental) groups.

Question

Does it exist a (compact) manifold *M* satisfying some topological property (e.g. b_{2k+1} even) admitting complex/symplectic structure but not admitting a Kähler structure?

- $(\mathcal{M}, d) \longrightarrow (A, d)$ is a quasi-isomorphism.

A minimal model (\mathcal{M}_X, d) for X is a minimal model for $(\Omega X, d)$.

Theorem (Sullivan, 1977)

If either X is simply-connected or X is a nilpotent space, then the minimal model $(\mathcal{M}_X, d) \longrightarrow (\Omega X, d)$ codifies the rational homotopy of X. More specifically, $\mathcal{M}_X = \bigwedge V$, $V = \bigoplus_{n \ge 1} V^n$, where V^n is the vector space given by the degree n generators. Then

$$V^n\cong (\pi_n(X)\otimes\mathbb{R})^*$$
,

and

$$H^n(\bigwedge V, d) = H^n(\Omega(X), d) = H^n(X).$$

A CDGA (A, d) is formal if $(A, d) \sim (H, 0)$.

Clearly, it is H = H(A, d). So there are quasi-isomorphisms

So the minimal model can be deduced *formally* from H = H(A, d). All rational homotopy information is in the cohomology algebra.

A space X is formal if $(\Omega X, d)$ is formal.

Non-formal symplectic manifolds

The Kodaira-Thurston manifold is non-formal.

$$\begin{split} H &= \left\{ A = \begin{pmatrix} 1 & a & c \\ 0 & 1 & b \\ 0 & 0 & 1 \end{pmatrix} \mid (a, b, c) \in \mathbb{R}^3 \right\} / \mathbb{Z}^3 \\ KT &= H \times S^1. \\ \alpha &= da, \beta = db, \eta = dc - b \, da, \gamma = d\theta, \, d\eta = \alpha \wedge \beta. \\ \text{The minimal model is } (\Lambda(\alpha, \beta, \gamma, \eta), d). \\ H^*(H) &= H^*(\Lambda(\alpha, \beta, \eta), d) = \langle 1, [\alpha], [\beta], [\alpha \wedge \eta], [\beta \wedge \eta], [\alpha \wedge \beta \wedge \eta] \rangle. \end{split}$$

Non-formal symplectic manifolds

The Kodaira-Thurston manifold is non-formal.

$$\begin{split} H &= \left\{ A = \begin{pmatrix} 1 & a & c \\ 0 & 1 & b \\ 0 & 0 & 1 \end{pmatrix} \mid (a, b, c) \in \mathbb{R}^3 \right\} / \mathbb{Z}^3 \\ KT &= H \times S^1. \\ \alpha &= da, \beta = db, \eta = dc - b \, da, \gamma = d\theta, \, d\eta = \alpha \wedge \beta. \\ \text{The minimal model is } (\Lambda(\alpha, \beta, \gamma, \eta), d). \\ H^*(H) &= H^*(\Lambda(\alpha, \beta, \eta), d) = \langle 1, [\alpha], [\beta], [\alpha \wedge \eta], [\beta \wedge \eta], [\alpha \wedge \beta \wedge \eta] \rangle. \\ \text{There is no quasi-isomorphism} \end{split}$$

$$\begin{split} & (\Lambda(\alpha,\beta,\eta),\boldsymbol{d}) \longrightarrow H^*(\Lambda(\alpha,\beta,\eta),\boldsymbol{d}) \\ & \alpha \mapsto [\alpha], \\ & \beta \mapsto [\beta], \\ & \eta \mapsto \boldsymbol{x}[\alpha] + \boldsymbol{y}[\beta], \\ & \alpha \wedge \eta \mapsto \boldsymbol{x}[\alpha] \wedge [\alpha] + \boldsymbol{y}[\alpha] \wedge [\beta] = \boldsymbol{0} \end{split}$$

< 17 ▶

Non-formal symplectic manifolds

The Kodaira-Thurston manifold is non-formal.

$$\begin{split} H &= \left\{ A = \begin{pmatrix} 1 & a & c \\ 0 & 1 & b \\ 0 & 0 & 1 \end{pmatrix} \mid (a, b, c) \in \mathbb{R}^3 \right\} / \mathbb{Z}^3 \\ KT &= H \times S^1. \\ \alpha &= da, \beta = db, \eta = dc - b \, da, \gamma = d\theta, \, d\eta = \alpha \wedge \beta. \\ \text{The minimal model is } (\Lambda(\alpha, \beta, \gamma, \eta), d). \\ H^*(H) &= H^*(\Lambda(\alpha, \beta, \eta), d) = \langle 1, [\alpha], [\beta], [\alpha \wedge \eta], [\beta \wedge \eta], [\alpha \wedge \beta \wedge \eta] \rangle. \\ \text{There is no quasi-isomorphism} \end{split}$$

$$\begin{array}{c} (\Lambda(\alpha,\beta,\eta),\boldsymbol{d}) \longrightarrow H^*(\Lambda(\alpha,\beta,\eta),\boldsymbol{d}) \\ \alpha \mapsto [\alpha], \\ \beta \mapsto [\beta], \\ \eta \mapsto \boldsymbol{x}[\alpha] + \boldsymbol{y}[\beta], \\ \alpha \wedge \eta \mapsto \boldsymbol{x}[\alpha] \wedge [\alpha] + \boldsymbol{y}[\alpha] \wedge [\beta] = \boldsymbol{0} \end{array}$$

Hence KT is non-formal.

Theorem [Bazzoni-Muñoz, 2014]

The previous manifold admits a complex structure.

< □ > < 同 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □

Theorem [Fernández-Muñoz, 2008]

There is a simply-connected 8-dimensional symplectic manifold which is not formal. Hence it does not admit Kähler structures.

Theorem [Bazzoni-Muñoz, 2014]

The previous manifold admits a complex structure.

Theorem [Bazzoni-Fernández-Muñoz, 2014]

There is a simply-connected 6-dimensional manifold complex and symplectic which is not hard-Lefschetz. Hence it does not admit Kähler structures.

Non-formal 8-dimensional orbifold

Let
$$H = \left\{ A = \begin{pmatrix} 1 & a & c \\ 0 & 1 & b \\ 0 & 0 & 1 \end{pmatrix} \mid a, b, c \in \mathbb{C} \right\}$$

 $\Gamma = \{ A \in H \mid a, b, c \in \Lambda \}$
 $\Lambda = \mathbb{Z} + \xi \mathbb{Z}, \xi = e^{2\pi i/3}$
Let $M = H/\Gamma \times \mathbb{C}/\Lambda$ is an 8-dimensional nilmanifold.

æ

Non-formal 8-dimensional orbifold

Let
$$H = \left\{ A = \begin{pmatrix} 1 & a & c \\ 0 & 1 & b \\ 0 & 0 & 1 \end{pmatrix} \mid a, b, c \in \mathbb{C} \right\}$$

 $\Gamma = \{A \in H \mid a, b, c \in \Lambda\}$
 $\Lambda = \mathbb{Z} + \xi \mathbb{Z}, \xi = e^{2\pi i/3}$
Let $M = H/\Gamma \times \mathbb{C}/\Lambda$ is an 8-dimensional nilmanifold.
 $\mathbb{C}/\Lambda \rightarrow H/\Gamma \rightarrow (\mathbb{C}/\Lambda) \times (\mathbb{C}/\Lambda), (a, b, c) \mapsto (a, b).$
 $\alpha = da, \beta = db, \eta = dc - b da, \gamma = dz.$
 $\alpha = \alpha_1 + i\alpha_2, \beta = \beta_1 + i\beta_2, \eta = \eta_1 + i\eta_2, \gamma = \gamma_1 + i\gamma_2.$
The minimal model is $(\Lambda(\alpha, \bar{\alpha}, \beta, \bar{\beta}, \eta, \bar{\eta}, \gamma, \bar{\gamma}), d), d\eta = \alpha \wedge \beta.$

2

(a) < (a) < (b) < (b)

Let
$$H = \left\{ A = \begin{pmatrix} 1 & a & c \\ 0 & 1 & b \\ 0 & 0 & 1 \end{pmatrix} \mid a, b, c \in \mathbb{C} \right\}$$

 $\Gamma = \{A \in H \mid a, b, c \in \Lambda\}$
 $\Lambda = \mathbb{Z} + \xi \mathbb{Z}, \xi = e^{2\pi i/3}$
Let $M = H/\Gamma \times \mathbb{C}/\Lambda$ is an 8-dimensional nilmanifold.
 $\mathbb{C}/\Lambda \to H/\Gamma \to (\mathbb{C}/\Lambda) \times (\mathbb{C}/\Lambda), (a, b, c) \mapsto (a, b).$
 $\alpha = da, \beta = db, \eta = dc - b da, \gamma = dz.$
 $\alpha = \alpha_1 + i\alpha_2, \beta = \beta_1 + i\beta_2, \eta = \eta_1 + i\eta_2, \gamma = \gamma_1 + i\gamma_2.$
The minimal model is $(\Lambda(\alpha, \bar{\alpha}, \beta, \bar{\beta}, \eta, \bar{\eta}, \gamma, \bar{\gamma}), d), d\eta = \alpha \land \beta.$
 $M = H/\Gamma \times \mathbb{C}/\Lambda$ is 8-dimensional and non-formal but not
simply-connected.

 $\widehat{M} = M/\mathbb{Z}_3$ is an orbifold with $3^4 = 81$ singular points. It is simply-connected.

 $\widehat{M} = M/\mathbb{Z}_3$ is an orbifold with $3^4 = 81$ singular points. It is simply-connected.

 $\hat{\omega} = -i\alpha \wedge \bar{\alpha} + \eta \wedge \beta + \bar{\eta} \wedge \bar{\beta} - i\gamma \wedge \bar{\gamma}, \mathbb{Z}_3$ -equivariant symplectic form.

 $\widehat{M} = M/\mathbb{Z}_3$ is an orbifold with $3^4 = 81$ singular points. It is simply-connected.

 $\hat{\omega} = -i\alpha \wedge \bar{\alpha} + \eta \wedge \beta + \bar{\eta} \wedge \bar{\beta} - i\gamma \wedge \bar{\gamma}, \mathbb{Z}_3$ -equivariant symplectic form. $(\hat{M}, \hat{\omega})$ is a symplectic orbifold. (\hat{M}, \hat{J}) is a complex orbifold.

 $\widehat{M} = M/\mathbb{Z}_3$ is an orbifold with $3^4 = 81$ singular points. It is simply-connected.

 $\hat{\omega} = -i\alpha \wedge \bar{\alpha} + \eta \wedge \beta + \bar{\eta} \wedge \bar{\beta} - i\gamma \wedge \bar{\gamma}, \mathbb{Z}_3$ -equivariant symplectic form. $(\hat{M}, \hat{\omega})$ is a symplectic orbifold. (\hat{M}, \hat{J}) is a complex orbifold.

The CDGA of \hat{M} is $(\bigwedge (\alpha, \bar{\alpha}, \beta, \bar{\beta}, \eta, \bar{\eta}, \gamma, \bar{\gamma})^{\mathbb{Z}_3}, d)$. $\implies \hat{M}$ is non-formal.

Symplectic resolution of singularities

Local model around a singular point: $B \cong (B(0, 1)/\langle (\xi, \xi, \xi^2, \xi) \rangle, \hat{\omega})$. With change of variables $(a', b', c', z') = (a, b - i\bar{c}, \bar{b} - ic, z)$, $\hat{\omega} = -ida' \wedge d\bar{a}' - idb' \wedge d\bar{b}' - idc' \wedge d\bar{c}' - idz' \wedge d\bar{z}'$. $\psi : B \xrightarrow{\cong} (B(0, 1)/\langle (\xi, \xi, \xi^2, \xi) \rangle, \omega_{std})$.

Symplectic resolution of singularities

Local model around a singular point: $B \cong (B(0,1)/\langle (\xi,\xi,\xi^2,\xi)\rangle,\hat{\omega})$. With change of variables $(a',b',c',z') = (a,b-i\bar{c},\bar{b}-ic,z)$, $\hat{\omega} = -ida' \wedge d\bar{a}' - idb' \wedge d\bar{b}' - idc' \wedge d\bar{c}' - idz' \wedge d\bar{z}'$. $\psi : B \xrightarrow{\cong} (B(0,1)/\langle (\xi,\xi,\xi^2,\xi)\rangle, \omega_{std})$.

Take a standard complex resolution $\pi: \widetilde{B} \to B$,

The symplectic resolution is $\widetilde{M}_s = (\widehat{M} - \{0\}) \cup_{\psi} \widetilde{B}$. Glue the symplectic forms on \widehat{M} and \widetilde{B} to get $(\widetilde{M}_s, \widetilde{\omega})$.

Symplectic resolution of singularities

Local model around a singular point: $B \cong (B(0,1)/\langle (\xi,\xi,\xi^2,\xi)\rangle,\hat{\omega})$. With change of variables $(a',b',c',z') = (a,b-i\bar{c},\bar{b}-ic,z)$, $\hat{\omega} = -ida' \wedge d\bar{a}' - idb' \wedge d\bar{b}' - idc' \wedge d\bar{c}' - idz' \wedge d\bar{z}'$. $\psi : B \xrightarrow{\cong} (B(0,1)/\langle (\xi,\xi,\xi^2,\xi)\rangle, \omega_{std})$.

Take a standard complex resolution $\pi: \widetilde{B} \to B$,

The symplectic resolution is $\widetilde{M}_s = (\widehat{M} - \{0\}) \cup_{\psi} \widetilde{B}$. Glue the symplectic forms on \widehat{M} and \widetilde{B} to get $(\widetilde{M}_s, \widetilde{\omega})$.

Non-formal symplectic and complex 8-manifold

The complex resolution is $\widetilde{M}_c = (\widehat{M} - \{0\}) \cup_{\varphi} \widetilde{B}$. $\varphi : B \xrightarrow{\cong} (B(0,1)/\langle (\xi,\xi,\xi^2,\xi) \rangle, J_{std})$, with variables (a,b,c,z).

Non-formal symplectic and complex 8-manifold

The complex resolution is $\widetilde{M}_c = (\widehat{M} - \{0\}) \cup_{\varphi} \widetilde{B}$. $\varphi : B \xrightarrow{\cong} (B(0,1)/\langle (\xi,\xi,\xi^2,\xi) \rangle, J_{std})$, with variables (a,b,c,z).

Locally, the symplectic and complex resolutions coincide, but using different charts!

Non-formal symplectic and complex 8-manifold

The complex resolution is $\widetilde{M}_c = (\widehat{M} - \{0\}) \cup_{\varphi} \widetilde{B}$. $\varphi : B \xrightarrow{\cong} (B(0,1)/\langle (\xi,\xi,\xi^2,\xi) \rangle, J_{std})$, with variables (a,b,c,z).

Locally, the symplectic and complex resolutions coincide, but using different charts!

The complex resolution is $\widetilde{M}_c = (\widehat{M} - \{0\}) \cup_{\varphi} \widetilde{B}$. $\varphi : B \xrightarrow{\cong} (B(0,1)/\langle (\xi,\xi,\xi^2,\xi)\rangle, J_{std})$, with variables (a, b, c, z).

Locally, the symplectic and complex resolutions coincide, but using different charts!

 \widetilde{M}_s and \widetilde{M}_c are diffeomrophic. Hence \widetilde{M}_s admit complex and symplectic structures. The complex resolution is $\widetilde{M}_c = (\widehat{M} - \{0\}) \cup_{\varphi} \widetilde{B}$. $\varphi : B \xrightarrow{\cong} (B(0,1)/\langle (\xi,\xi,\xi^2,\xi) \rangle, J_{std})$, with variables (a, b, c, z).

Locally, the symplectic and complex resolutions coincide, but using different charts!

 \widetilde{M}_s and \widetilde{M}_c are diffeomrophic.

Hence M_s admit complex and symplectic structures.

 \widetilde{M}_s is non-formal. So it does not admit Kähler structures.

The complex resolution is $\widetilde{M}_c = (\widehat{M} - \{0\}) \cup_{\varphi} \widetilde{B}$. $\varphi : B \xrightarrow{\cong} (B(0,1)/\langle (\xi,\xi,\xi^2,\xi) \rangle, J_{std})$, with variables (a, b, c, z).

Locally, the symplectic and complex resolutions coincide, but using different charts!

 \widetilde{M}_s and \widetilde{M}_c are diffeomrophic.

Hence \widetilde{M}_s admit complex and symplectic structures.

 \widetilde{M}_s is non-formal. So it does not admit Kähler structures.
